

# Exotic Birds: Phoenix

How to get yourself a fiery bird mount (Or the other forms you may hatch it into)

Phoenixes are from the mod [Exotic Birds](#) and do not naturally spawn in the wild. You may find Phoenix Dust as loot in Dungeons and Towers. Right clicking a phoenix with a saddle will put a saddle on it, after which you can ride it.

To get a phoenix you'll need to hatch a phoenix egg. To do this you'll need to surround an egg with Phoenix Dust in a crafting table to get a phoenix egg.

Once you have this phoenix egg you'll need to place it in an area with a light level of at least 9. You'll know you're at a high enough light level if the egg gives off flame particles.

There are 8 different types of phoenixes that all require to be hatched for 2 Minecraft Days (40 Real Life minutes) in a loaded chunk. [Breaking the Egg resets the timer]

Black Phoenix:

- Hatch the egg during a full moon
- Takes damage from water

Cloud Phoenix:

- Hatch the egg above the clouds. (Over y 128)
- Immune to water damage

Desert Phoenix:

- Hatch the egg in a desert biome
- Takes damage from water

Ender Phoenix:

- Hatch the egg in the End
- Takes damage in water and will teleport when it comes in contact with it

Nether Phoenix:

- Hatch the egg in the Nether
- Immune to Fire Damage

#### Snow Phoenix:

- Hatch the egg in a snowy biome
- It takes damage in warm biomes (Jungle, Deserts, etc)

#### Water Phoenix:

- Hatch the egg in an ocean biome
- Immune to water damage

#### Regular Phoenix:

- Will hatch if none of the other phoenix requirements are met
- Takes damage from water
